Logitech Sight

A Hybrid Meeting Room Solution that Enhances the Remote Employee Experience

The D&H Tech Solutions team conducted a demo test of Logitech's Sight tabletop camera conference room solution in the D&H Solutions Lab during a few hybrid training sessions in December 2023 after receiving a live demo training in November 2023 from Logitech.

REMOTE CHALLENGES

We surveyed a few of our co-owner's and identified these pain points during a hybrid meeting that remote participates experience.

- In large meeting spaces, it's difficult to see all in-person attendees in camera view which can cause missing verbal and non-verbal communication from speaker and other meeting attendees, as well as, not being aware of who's talking in the meeting.

- Not fully engaged due to invisible barrier between remote and in-person participants

Like many other companies, we are experiencing the challenges of collaboration among remote and in-person employees that has ignited since the 2020 pandemic.

LOGITECH SIGHT

Sight is a tabletop companion camera that works in tandem with Logitech Rally Bar or Rally Bar Mini to provide a front-and-center view of meeting participants around the table. With seamless integration with all major video conferencing platforms, Sight enhances your hybrid meeting experience by capturing audio and video deeper into the room, making remote attendees feel more included and engaged.

logitech

> With the increase in remote and hybrid meeting structures since the pandemic, you need to provide an enhanced experienced to keep everyone engaged and connected. The lack of engagement translates to an ineffective meeting or training if remote participants are not able to fully see and hear all in-person attendees which is a waste of time and money.

DEMO TEST

We connected the Logitech Sight to the Logitech Rally Bar. With it's 7.5' range, we placed the Sight in the middle of our long table setup to capture all attendees around the table.

After a quick software update and basic configuration of audio settings, we kicked off our first meeting with Sight and all attendees, remote and in-person, were in shock of what they saw.

Sight will show up to 4 frames of people by detecting their audio within 2 seconds of them speaking. If no one is speaking, Sight will display the farthest people from the Rally Bar or Rally Bar Mini. This visual aspect enables remote meeting participants to be more fully engaged in conversations, in addition to, not missing verbal and non-verbal communication.

Shown above is what a remote attendee sees on the screen with Sight. You can see the difference in perspective with the picture-in-picture view when using only the Rally Bar where in-person attendees seem distant.

We continued to use the Sight for additional meetings through-out the month and received positive feedback. Remote participants loved feeling closer to the in-person participants as if they were seated at the table with them. They could clearly tell who was talking in the meeting particularly when side conversations occurred as Sight would pick up the audio and visually display those participants. Not only did the remote attendees have an enhanced experience but even in-person attendees felt more connected to those seated at the far end of the table with the digital display screen showing the Sight view at full screen.
